

Recmix and Recoval are recycling companies that recycle slag coming from the steel industry in Genk and Châtelet.

The slags are stocked on an open site, where they are treated by spraying of rain water. This rain water is collected in large water tanks on the site and pumped around to spray the slag. Zero discharge of waste is applied on both sites.

Trucks are taking care of the transportation of the product. When entering the site, the weight of the trucks is determined on weighing bridge. When leaving the site, trucks were cleaned with water and their weight is determined again.

Project coordination of investments

RECOVAL, August 2008 - August 2009,
Belgium(Farciennes)

PRIMARY

PROJECT REALIZATION

BELGIUM

Principal project data

- Completion of site infrastructure
- Installation of site utilities
- Installation of security systems
